IMPROVE
WORKPLACE
ACOUSTICS

Sound masking promotes speech privacy and reduces accidental eavesdropping, creating more productive workspaces that allow employees to focus on the task at hand.

Sound Masking is a specifically tuned ambient background sound that targets the same frequency as human speech, reducing its intelligibility. Adding sound to a space actually makes the space seem quieter. It sounds counter-intuitive but it's true. This is because the added sound reduces the intelligibility of human speech.

SOUND MASKING

Similar to the
sound of airflow
or static on a TV

By adding sound masking to a workplace, surrounding conversations are notably less intelligible or noticeable, and thus less distracting. The workplace becomes more comfortable, private, and productive.
